

Erlang touts Alpha Wireless solutions

Alpha Wireless' antenna solutions have been endorsed by Indian infrastructure provider Erlang in a [report](#) looking at ways to improve mobile cell sites.

The report details a number of problems with Cell on Wheels (CoW) sites, which were initially installed as temporary solutions but have become permanent city sites across India.

As well as eating into public areas such as parking and utility spaces, Erlang notes that portable base stations cause “visual pollution”, failing to provide aesthetic value to the area that surrounds them.

The report makes it clear that new antennas will play a crucial role in improving mobile sites in India, and names Alpha Wireless as the supplier able to provide forward-thinking and fast solutions.

In a list, Erlang emphasises the benefits of using Alpha Wireless for such a project, outlining the company's capabilities:

“To design a compact antenna solution; To design a future-proof antenna solution covering all frequency bands 698-2690MHz; To design an antenna site solution which is quick to build (typically one working day); To design an antenna site solution which may be deployed to cater to coverage as well as 4x4 MiMo capacity demand in High Band.”

Alpha Wireless CEO Fergal Lawlor says the recognition from Erlang underscores the great work that Alpha is producing to improve the appearance of cell sites around the world and how progressive the company's solutions are.

“The visual impact of cell sites is a constant concern for multiplicities and network operators, so concealment, sustainability and preserving landscapes is a key focus for Alpha Wireless,” Lawlor says.

“We're proud to be known as an innovator in the industry, and go out of our way to create antenna solutions specifically to fit customers' needs – even if that means designing entirely new products. The Erlang report singles Alpha out as a world leader and is a welcome reminder to us that we are hitting our goal of changing the way wireless networks are built.”
